

Cloud Training: Mastering Kubernetes (KUBEIMP, 4 jours)

Tarifs

- Tarification: \$3,750/person
- Rabais de 10% lorsque vous inscrivez 3 personnes.

Plan de cours

Getting things Ready: Docker

- Containerization vs Virtualization
- Getting Excited about Docker
- Architecture of Images
- Spinning up a Container
- About Container Lifetime
- Understanding Volumes and Bind Mounts
- Understanding Container Networking
- Building a Swarm
- About Dockerfile and Docker Compose
- Creating an Image
- Creating a Repository

Introduction: Kubernetes Architecture and Components

- The Role of Kubernetes: Docker and Microservice Delivery
- Exploring Cluster Architecture: Master and Node
- Master Services: etcd, kube-apiserver, kube-controller-manager, kube-scheduler and cloud-controller-manager
- Node Services: Docker, kubelet and kube-proxy
- Objects and Workloads: Pods, Replication Sets and Controllers, Deployments, Stateful Sets, Daemon Sets, Jobs
- More to Explore: Services, Volumes, Labels and Annotations
- Putting it all Together

Setting up the Kubernetes Cluster

- Preparing the Servers: Required Software and Configuration
- Setting up the Host Network and Firewall
- Adding the Kubernetes Repo
- Installing kubeadm and other Services
- Initializing the Master and Joining the Nodes
- Configuring Users and Security
- Exploring Networking Options
- Configuring Pods

The World of Pods

- Pod Design Principles for Enterprise Applications
- Pods: Concepts and Networking
- Exploring yaml Descriptors and kubectl
- Creating a Pod
- Configuring Pod Access
- Organizing Pods with Labels
- Exploring Label Operations
- Scheduling Pods to Nodes

Working with Annotations and Namespaces

Managing Pod Lifecycle

Replication, Controllers and Daemon Sets

Component Overview

Working with Liveness Probes

Exploring Replication Controllers and The Replication Process

Creating a Replication Controller

Working with the Replication Controller

Exploring ReplicaSets and Pods

Creating and Managing a ReplicaSet

Creating and Managing a DaemonSet

Creating and Managing a Job

Exploring Use Cases in and Enterprise Context

Exploring Services

About Services and Service Entry Points

Creating and Managing Services

Connecting Services to the Outside World

Making Services accessible to External Clients

Exploring NodePort for External Service Delivery

Exploring JsonPath for External Service Delivery

Exploring Ingress Resources for External Service Delivery

Launching the Service

About Headless Services

Managing Storage

Providing External Storage: Overview and Architecture

About Volumes and Volume Types

Sharing Data between Containers

Accessing the Worker Node Filesystem

Using Persistent Storage

Implementing Pod Independent Storage

Kubernetes to Container Information Exchange

Architecture and Concepts

Passing Command Line Arguments to Applications

Setting Environment Variables for a Container

Creating and Using a ConfigMap for Configuration

Passing Sensitive Data to Containers using Secret

Exploring the Downward API

Exploring the Kubernetes REST API

Authentication and Server Verification

Accessing the API server from a Container

Deployments

Concepts and Use

Upgrading Pods

Creating and Using Deployment Resources

Managing Pod Rollouts and their Lifecycle

Deploying Stateful Clustered Applications

Creating Pod Replicas

Managing Pod Replicas: Storage, Name and Hostname

About Certificates and Security

About Performance and Available Resources
