

Server 2022 Training: Installation, Management & Troubleshooting (SRV16C, 4 jours)

Description

The course Installation, Management & Troubleshooting (Server 2019 Training) explores Windows Server 2019 system administration. The training covers server installation & configuration including Active Directory domain services, domains & forests, DNS, DHCP & more. The course discusses Active Directory user accounts & security groups, file systems & file sharing, the Windows firewall, IPv4 & IPv6 addressing, disks & partitions to name a few. You learn to monitor a Windows Server 2019 and to troubleshoot everything from server startup to connectivity problems & security breaches. This is a complete exploration of Windows Server 2019.

Plan de cours

Introducing Windows Server 2022

Windows Server 2016 Overview

Installing Windows Server 2016 R2

Upgrading from Server 2008 R2

Windows Server 2016 Configuration

Windows Server 2016 Management

The Role of the Domain Controller

Introduction to Active Directory: Forests, Trees and Domains

The Role of GPOs

Working with PowerShell

Working with Active Directory Domain Services

Understanding the Domain Structure

About Read-Only Domain Controllers

Installing Active Directory Domain Services

Configuring Active Directory Domain Services

Understanding the Role of Organizational Units

Exploring Security Groups

Working with User Accounts

Working with Computer Accounts

Working with Service Accounts

Delegating Administration

Exploring NTFS Permissions

More on Active Directory Management

Implementing Audit and Control

Exploring Command Line Tools for ADDS Administration

Exploring PowerShell Extensions for ADDS Administration

Performing Common Operations with PowerShell

Performing Bulk Operations with PowerShell

Implementing TCP/IP

TCP/IP Addressing Essentials: IPv4

Overview of IP Communication: Local and Remote

The Logical Network in IPv4: IP Addresses and Subnets

Considering the Role of VLANs

About Network Services: DHCP and DNS

Configuring IPv4 Networking

Using NIC Teams

Troubleshooting IPv4 Networking

Overview of IPv6 (Optional)

Configuring IPv6 Networking (Optional)

Configuring IPv6 Services (Optional)

Implementing Dynamic Addressing with DHCP

Considerations for a DHCP Implementation: Routers and Virtual Networks

Overview of the DHCP Leasing Process

Installing the DHCP Role

Creating and Managing Scopes

Managing and Monitoring DHCP

Troubleshooting DHCP

Implementing DNS

Understanding the Host Name Resolution Process

The Role of the DNS Server: Primary and Stub Zones

Installing the DNS Role

Creating Forward Lookup Zones

Creating Reverse Lookup Zones

Understanding the ADDS Records

Creating A and AAAA Records

Managing and Monitoring DNS

Troubleshooting DNS

About Name Resolution on Linux Machines (Optional)

Implementing Local Storage

Overview of Disks, Volumes and File Systems

Installing File and Storage Services

Working with Disks

Working with FDISK

Creating and Managing Volumes

Creating and Managing Storage Spaces

Checking for Drive Integrity and Faults

Troubleshooting Local Storage

Implementing File and Print Services

Creating and Managing Shares

Working with Shadow Copies

Implementing Share Security

Installing and Managing DFS

Creating and Managing a DFS Tree

Working with iSCSI

Configuring Network Printing

Exploring Group Policy

The Role of Group Policy

About GPOs and where they are Linked

Working with Templates and OUs

Creating a GPO

Linking a GPO

Pushing Changes with GPO

Determining Net Effect

Mastering Security

Using GPOs for Security

Controlling Default Behaviors

Restricting User Actions and OS Configuration

Configuring Windows Firewall

Restricting Software

Troubleshooting GPOs

Mastering Troubleshooting

The Importance of the Information Management Process

Configuring and Working with Event Logs

Overview of Troubleshooting Methods

Using Tools to Detect Weaknesses and Survey the Topology

Using Network Sniffers to understand the traffic

Deciphering the Packets and Taking Action
